- 4 Vector-driven dynamics
- 5 Time-varying rate of infection

6 Conclusions

Introduction

SIR Model

$$\begin{cases} \dot{\boldsymbol{S}} = -\alpha \boldsymbol{I} \boldsymbol{S} \\ \dot{\boldsymbol{I}} = \alpha \boldsymbol{I} \boldsymbol{S} - \beta \boldsymbol{I} \end{cases}$$

- Based on the mass action law
- α: Rate of infections
- β : Rate of deaths
- No growth included!
- All the infected animals die

$$\begin{cases} \dot{S} = -\alpha I S + \gamma S \\ \dot{I} = \alpha I S - \beta I \end{cases}$$

Exponential growth in the absence of a disease (Malthus 1798)

- Logistic model is better
- Parameters? Nondimensionalisation

$$\begin{cases} \hat{\hat{S}} = -\hat{l}\hat{S} + \kappa\hat{S} \\ \hat{\hat{l}} = \hat{l}\hat{S} - \lambda\hat{l} \end{cases}$$

Parameters that describes the dynamics of the disease:

- κ is the birth rate relative to the infection rate.
- λ is the death rate relative to the infection rate.

The higher the λ (higher mortality rate of disease), the better?

$\lambda > 1$: disease with high mortality rate

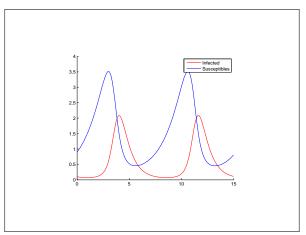

Figure: Evolution of the infected and the susceptible subjects, for $\kappa = 0.6$ and $\lambda = 1.5$

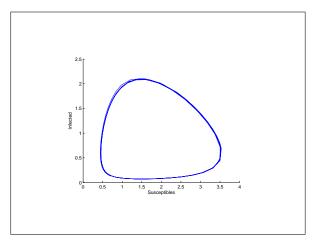

Figure: Phase portrait for $\kappa < 1$ and $\lambda > 1$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

$\lambda < \mathbf{1}$: disease with low mortality rate

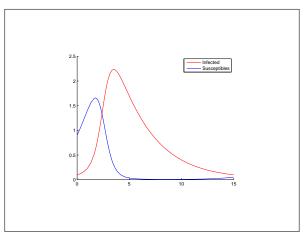

Figure: Evolution of the infected and the susceptible subjects, for $\kappa = 0.6$ and $\lambda = 0.3$

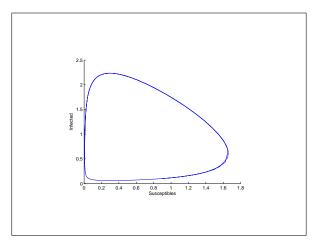

Figure: Phase portrait for $\kappa < 1$ and $\lambda < 1$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

$$\begin{cases} \hat{\dot{S}} = -\hat{l}\hat{S} + \kappa S(1-S) \\ \hat{\dot{l}} = \hat{l}\hat{S} - \lambda I \end{cases}$$

The parameters describe almost the same way the dynamics of the disease:

- κ is the birth rate relative to the infection rate.
- λ is the death rate relative to the infection rate.

$\lambda > 1$: disease with high mortality rate

Conclusion: We should seek for a contagious disease rather than a fast and agressive one, in other to spread it among the subjects

Two equilibrium solutions that exist for all parameter values are A(0,0,0) and B(1,0,0). Additional equilibrium point $C(\lambda, \kappa(1-\lambda), \kappa(1-\lambda))$ exists only if $\lambda < 1$.

A is always a saddle point while B is asymptotically stable for $\lambda > 1$.

(日) (日) (日) (日) (日) (日) (日)

When the point C exists it is asymptotically stable while B becomes unstable.

Conclusions

- 2 SIR Model
- Incorporating growth
- 4 Vector-driven dynamics
- 5 Time-varying rate of infection

6 Conclusions

Conclusions

- Logistic growth more realistic than exponential one
- The key parameter for virulence is R₀
- The spatiotemporal dynamics shows a spreading wave front
- Vector-driven is a more realistic transmission model
- When the disease is seasonal the variation of populations is periodic

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Future work

- Two-dimensional spatial model
- Genetic immunity
