Freckles, volcanoes and rivers: channelisation in the industrial and scientific world

The application of mathematics to real, physical problems finds its inspiration in the unification which it brings to phenomena which appear to be completely unrelated. In this talk I will describe some phenomena which involve the formation of channelised flow, and some of the particular features of the models which describe them.

Organizado por MOMAT (Grupo de Investigación de la UCM) con la colaboración del Instituto de Matemática Interdisciplinar de la UCM.
