## 1 Introduction.

Let  $\Omega$  be a bounded open subset of  $\mathbb{R}^N$  of class  $C^{2m}$ ,  $T > 0$ ,  $\omega$  a nonempty open subset of  $\Omega$ ,  $f$  a continuous real function and  $k \in \mathbb{N}$  such that  $0 \leq 2k < m$ . The main goal of this communication is the study of the approximate controllability of the Dirichlet problem

$$(1) \quad \begin{cases} y_t + (-\Delta)^m y + f(\Delta^k y) = h + v\chi_\omega & \text{in } Q := \Omega \times (0, T) \\ \frac{\partial^j y}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma := \partial\Omega \times (0, T) \\ y(0) = y_0 & \text{in } \Omega, \end{cases}$$

where  $v$  is a suitable output control,  $\chi_\omega$  is the characteristic function of  $\omega$ ,  $\nu$  is the unit outward normal vector,  $h \in L^2(Q)$  and  $y_0 \in L^2(\Omega)$ . Due to the factor  $\chi_\omega$  the controls are supported on the set  $\mathcal{O} := \omega \times (0, T)$ .

**Definition 1** *We say that Problem (1) has the approximate controllability property at time  $T$  with state space  $X$  and control space  $Y$  if the set of solutions of (1) at time  $T$ , when  $v$  span  $Y$ , is dense in  $X$ .*

We obtain the following result on approximate controllability.

**Theorem 1** *Assume that  $f$  satisfies the following conditions: there exist some positive constants  $c_1$  and  $c_2$  such that*

$$(2) \quad |f(s)| \leq c_1 + c_2|s| \quad \text{for all } s \in \mathbb{R}$$

and

$$(3) \quad \text{there exists } f'(s_0) \text{ for some } s_0 \in \mathbb{R}.$$

*Then problem (1) has the approximate controllability property at time  $T$  with state space  $L^2(\Omega)$  and control space  $L^2(\mathcal{O})$ .*

**Remark 1** *For the sake of simplicity of the notation we chose  $L^2(\mathcal{O})$  as control space but following the proof it's easy to see that if we change the norm in (27) we can also choose  $L^\infty(\mathcal{O})$  if  $k = 0$  and  $L^\infty(0, T; H^{2k}(\Omega) \cap H_0^k(\Omega))$  if  $k \geq 1$ .*

<sup>2</sup>Partially supported by the DGICYT, project AMB93/0199.

Condition (2) is a sublinear hypothesis (for large values of  $s$ ). Nevertheless, we shall prove that when  $f$  is superlinear the approximate controllability property does not hold in general, as explained in Section 6. Therefore, if for instance  $f(s) = |s|^{p-1}s$ , Theorem 1 gives a positive approximate controllability result for  $0 < p \leq 1$  and the results of section 6 a negative approximate controllability answer for  $1 < p < \infty$ . A similar negative answer for second order parabolic problems was given in Díaz and Ramos [6].

**Definition 2** *We say that a function*

$$y \in L^2(0, T; H_0^m(\Omega)) \cap C([0, T]; L^2(\Omega))$$

*is a solution of problem (1) if  $y$  satisfies the differential equation in  $\mathcal{D}'(Q)$  and  $y(0) = y_0$ .*

**Remark 2** *The existence of solutions is also obtained in the proof of Theorem 1 by using the Kakutani's fixed point theorem. The uniqueness can be easily proved if  $f$  is nondecreasing or Lipschitz, but that is not necessary in our arguments.*

**Remark 3** *Notice that as  $2k < m$  then if  $y$  is any solution of (1)  $\Delta^k u \in L^2(\Omega)$  and so, by (2),  $f(\Delta^k y) \in L^2(Q)$ . Besides the boundary conditions are satisfied in the sense that  $y(t) \in H_0^m(\Omega)$  for a.e.  $t \in (0, T)$ .*

## 2 Preliminaries.

We consider the spaces

$$V := L^2(0, T; H_0^m(\Omega)) \quad \text{and its dual} \quad V' = L^2(0, T; H^{-m}(\Omega))$$

and denote by  $\langle \cdot, \cdot \rangle$  the duality product between  $H^{-m}(\Omega)$  and  $H^m(\Omega)$  and by  $(\cdot, \cdot)$  the scalar product in  $L^2(\Omega)$ . The norm of  $V$  is defined by

$$\|y\|_V^2 = \sum_{j=0}^m \int_Q |D^j y|^2 dx dt$$

where

$$(4) \quad |D^j y|^2 := \sum_{|\alpha|=j} (D^\alpha y)^2$$

(the sum extending to all  $x$ -derivatives of order  $j$ ). By Poincaré's inequality we have that

$$(5) \quad \|y\|_V^2 \leq C \int_Q |D^m y|^2 dx dt.$$

We summarize some well-known properties of these spaces in the following two lemmas. We refer to Lions [9] or Lions and Magenes [12] for Lemma 1, and to [9] or Simon [15] for Lemma 2.

**Lemma 1** *The space  $\{y \in V : y_t \in V'\}$  is continuously imbedded in  $C([0, T]; L^2(\Omega))$ . If  $y, z \in V$  and  $y_t, z_t \in V'$  then*

$$(6) \quad \int_0^T \langle y_t + (-\Delta)^m y, z \rangle dt - \int_0^T \langle -z_t + (-\Delta)^m z, y \rangle dt \\ = (y(T), z(T)) - (y(0), z(0))$$

and

$$(7) \quad \int_0^T \langle y_t + (-\Delta)^m y, y \rangle dt = \int_Q |D^m y|^2 dx dt \\ + \frac{1}{2} \int_\Omega y(T, x)^2 dx - \frac{1}{2} \int_\Omega y(0, x)^2 dx.$$

**Lemma 2** *The space  $\{y \in V : y_t \in V'\}$  is compactly imbedded in  $L^2(Q)$ .*

**Lemma 3** *If  $0 \leq 2k < m$ , the space*

$$W = \{y \in L^2(0, T; H_0^{m+2k}(\Omega)); y_t \in L^2(0, T; H^{-m+2k}(\Omega))\}$$

*is continuously imbedded in  $\mathcal{C}([0, T]; H^{2k}(\Omega))$ . Besides, if  $y, z \in W$  then*

$$(8) \quad \int_0^T \langle y_t + (-\Delta)^m y, (-\Delta)^k z \rangle dt - \int_0^T \langle -z_t + (-\Delta)^m z, (-\Delta)^k y \rangle dt \\ = (y(T), (-\Delta)^k z(T)) - (y(0), (-\Delta)^k z(0))$$

**Proof.** To see that  $W$  is continuously imbedded in  $\mathcal{C}([0, T], H^{2k}(\Omega))$  is as in the previous lemma. The equality can be proved by taking  $z \in C_c^\infty(\Omega)$  and by using that  $C_c^\infty(\Omega)$  is dense in  $H_0^{m+2k}(\Omega)$ .

We proceed to study the problem

$$(9) \quad \begin{cases} y_t + (-\Delta)^m y + a(t, x)\Delta^k y = h & \text{in } Q \\ \frac{\partial^j y}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y(0) = y_0 & \text{in } \Omega. \end{cases}$$

Besides of  $h \in L^2(Q)$  and  $y_0 \in L^2(\Omega)$  we assume that

$$(10) \quad a \in L^\infty(Q) \quad \text{and} \quad \|a\|_{L^\infty(Q)} \leq M.$$

The following Proposition collects some basic results about problem (9).

**Proposition 1** *There exists a unique function  $y \in V \cap C([0, T]; L^2(\Omega))$  with  $y_t \in V'$  which solves Problem (9) and satisfies the estimate*

$$(11) \quad \|y\|_V + \|y_t\|_{V'} \leq C \left( \|h\|_{L^2(Q)} + \|y_0\|_{L^2(\Omega)} \right).$$

*where the constant  $C$  depends only on  $M$  (provided that  $\Omega, T$  and  $m$  are kept fixed). Besides, the solution  $y$  also satisfies that*

$$(12) \quad y \in L^2(\delta, T; H^{2m}(\Omega)) \quad \text{and} \quad y_t \in L^2((\delta, T) \times \Omega) \quad \text{for all } \delta \in (0, T).$$

### 3 A functional associated to a backward problem

Following Lions [11] and Fabre, Puel and Zuazua [7] [8] we consider

$$(13) \quad \varepsilon > 0, \quad y_d \in L^2(\Omega), \quad a \in L^\infty(Q)$$

and introduce the functional  $J = J(\cdot; a, y_d) : L^2(\Omega) \rightarrow \mathbb{R}$  defined by

$$(14) \quad J(\varphi^0) = \frac{1}{2} \left( \int_{\mathcal{O}} |\varphi(t, x)| dx dt \right)^2 + \varepsilon |\varphi^0|_{L^2(\Omega)} - \int_{\Omega} y_d \varphi^0 dx$$

where  $\varphi(t, x)$  is the solution of the backward problem

$$(15) \quad \begin{cases} -\varphi_t + (-\Delta)^m \varphi + a(t, x) \Delta^k \varphi = 0 & \text{in } Q := \Omega \times (0, T) \\ \frac{\partial^j \varphi}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma := \partial\Omega \times (0, T) \\ \varphi(T) = r(\varphi^0) & \text{in } \Omega \end{cases}$$

with  $r(\varphi^0)$  given by  $r(\varphi^0) = \varphi^0$  if  $k = 0$  and by the solution of

$$\begin{cases} (-\Delta)^k r = \varphi^0 & \text{in } \Omega \\ \frac{\partial^j r}{\partial \nu^j} = 0, \quad j = 0, \dots, k-1 & \text{on } \partial\Omega \end{cases}$$

if  $k \geq 1$ . We point out that  $r \in H^{2k}(\Omega) \cap H_0^k(\Omega)$  and  $\varphi \in W$ .

As usual in controllability theory we shall need to use a property of *unique continuation* for solutions of a linear problem (in our case Problem (15)).

**Lemma 4** *Let  $\omega$  be a nonempty open subset of  $\Omega$ . Assume that*

$$\varphi \in L^2(0, T; H_0^m(\Omega)) \cap C([0, T]; L^2(\Omega))$$

*is a solution of Equation (15) in  $\mathcal{D}'(Q)$  and that  $\varphi \equiv 0$  in  $\mathcal{O} = \omega \times (0, T)$ . Then  $\varphi \equiv 0$  in  $Q$ .*

**Proof.** From Proposition 1 (applied with the time inversed) we deduce that  $\varphi \in L^2(0, T - \delta; H^{2m}(\Omega))$  for all  $\delta \in (0, T)$ . Then Lemma 4 follows from Theorem 3.2 of Saut and Scheurer [14].

The following two results are easy adaptation of the similar ones given in [7], [8] for second order parabolic problems.

**Proposition 2** *Under the assumption (13) the functional  $J(\cdot; a, y_d)$  is continuous and strictly convex on  $L^2(\Omega)$  and verifies*

$$(16) \quad \liminf_{|\varphi^0|_2 \rightarrow \infty} \frac{J(\varphi^0; a, y_d)}{|\varphi^0|_2} \geq \varepsilon.$$

*Besides  $J(\cdot; a, y_d)$  attains its minimum at a unique point  $\hat{\varphi}^0$  in  $L^2(\Omega)$  and*

$$(17) \quad \hat{\varphi}^0 = 0 \quad \Leftrightarrow \quad |y_d|_2 \leq \varepsilon.$$

**Proposition 3** Let  $M$  be the mapping

$$\begin{aligned} M : L^\infty(Q) \times L^2(\Omega) &\rightarrow L^2(\Omega) \\ (a(t, x), y_d) &\longrightarrow \hat{\varphi}^0. \end{aligned}$$

If  $B$  is a bounded subset of  $L^\infty(Q)$  and  $K$  is a compact subset of  $L^2(\Omega)$ , then  $M(B \times K)$  is a bounded subset of  $L^2(\Omega)$ .

**Definition 3** Given  $V : X \rightarrow \mathbb{R} \cup \{+\infty\}$  a convex and proper function on the Banach space  $X$ , it is said that an element  $p_0$  of  $V'$  belongs to the set  $\partial V(x_0)$  (subdifferential of  $V$  at  $x_0 \in X$ ) if

$$V(x_0) - V(x) \leq (p_0, x_0 - x) \quad \forall x \in X.$$

**Remark 4** In the conditions of Definition 3,  $x_0$  minimizes  $V$  over  $X$  (or over a convex subset of  $X$ ) if and only if

$$0 \in \partial V(x_0).$$

**Proposition 4** Under the above conditions, if  $V$  is a lower semicontinuous function, then  $p_0 \in \partial V(x_0)$  if and only if

$$(p_0, x) \leq \lim_{h \rightarrow 0^+} \frac{V(x_0 + hx) - V(x_0)}{h} (< +\infty) \quad \forall x \in X.$$

For a proof see, for instance, Proposition 3 of page 187 and Theorem 16 of page 198 of Aubin-Ekeland [3].

**Remark 5** If  $V$  is differentiable its differential coincides with its subdifferential.

## 4 Approximate Controllability for the linear associated problem.

**Lemma 5** For every  $\varphi^0 \in L^2(\Omega)$ ,  $\varphi^0 \neq 0$  if  $\varphi$  is the solution of (15) verifying  $\varphi(T) = r(\varphi^0)$ , we have that

$$\partial J(\varphi^0; a, y_d) = \{\xi \in L^2(\Omega), \exists v \in \text{sgn}(\varphi)\chi_{\mathcal{O}} \text{ satisfying}$$

$$\begin{aligned} \int_{\Omega} \xi(x)\theta^0(x)dx &= \left( \int_{\mathcal{O}} |\varphi(t, x)|d\Sigma \right) \left( \int_{\mathcal{O}} v(t, x)\theta(t, x)d\Sigma \right) \\ &+ \varepsilon \int_{\Omega} \frac{\varphi^0(x)}{|\varphi^0|_2} \theta^0(x)dx - \int_{\Omega} y_d(x)\theta^0(x)dx \quad \forall \theta^0 \in L^2(\Omega), \end{aligned}$$

where  $\theta$  is the solution of (15) verifying  $\theta(T) = r(\theta^0)$ .

**Proof.** It is an easy modification of Proposition 2.4 of [8].

Before continue we need to introduce the control  $u_a$  given by  $u_a = |\hat{\varphi}|_{L^1(\mathcal{O})}v$  ( $v \in \text{sgn}(\hat{\varphi})\chi_{\mathcal{O}}$ ) if  $k = 0$  and by means of the solution of

$$\begin{cases} (-\Delta_x)^k u_a(t_0, \cdot) = |\hat{\varphi}|_{L^1(\mathcal{O})}v(t_0, \cdot)\chi_{\mathcal{O}} & \text{in } \mathcal{O} \cap \{t = t_0\} \\ \frac{\partial^j u_a}{\partial \nu^j} = 0 \quad j = 0, \dots, k-1 & \text{on } \partial[\mathcal{O} \cap \{t = t_0\}] \end{cases} \quad a.e \quad t_0 \in [0, T]$$

if  $k \geq 1$ . Here we point out that (since  $\|v\|_{L^\infty(Q)} \leq 1$ )

$$(18) \quad u_a \in L^\infty(Q) \quad \text{and} \quad \|u_a\|_{L^\infty(Q)} \leq \|\hat{\varphi}\|_{L^1(\mathcal{O})} \quad \text{if } k = 0$$

and

$$(19) \quad u_a \in L^\infty(0, T; H^{2k}(\Omega) \cap H_0^k(\Omega)), \quad \|u_a\|_{L^\infty(0, T; H^{2k}(\Omega) \cap H_0^k(\Omega))} \leq C \|\hat{\varphi}\|_{L^1(\mathcal{O})} \quad \text{if } k \geq 1.$$

Now we are ready to prove a linear version of Theorem 1.

**Theorem 2** *If  $|y_d|_2 > \varepsilon$  and  $\hat{\varphi}$  is the solution of (15) verifying  $\hat{\varphi}(T) = \hat{\varphi}^0$ , then there exists  $v \in \text{sgn}(\hat{\varphi})\chi_{\mathcal{O}}$  such that the solution of*

$$(20) \quad \begin{cases} y_t + (-\Delta)^m y + a(x, t)\Delta^k y = h + u_a \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j y}{\partial \nu^j} = 0 \quad (j = 0 \cdots (m-1)) & \text{on } \Sigma \\ y(0) = y_0 & \text{on } \Omega \end{cases}$$

verifies

$$y(T) = y_d - \varepsilon \frac{\hat{\varphi}^0}{|\hat{\varphi}^0|_2},$$

and then  $|y(T) - y_d|_2 = \varepsilon$ .

**Remark 6** If  $y_0 \equiv 0$ , and  $h \equiv 0$ , the case  $|y_d| \leq \varepsilon$  is trivially solved with the control  $u_a \equiv 0$ .

**Proof of Theorem 2.** By linearity we can assume  $y_0 \equiv 0$  and  $h \equiv 0$ , since in other case we can take  $y(T; 0)$  the solution of the problem with null control and after we can take the new desired state  $y'_d = y_d - y(T; 0) \in L^2(\Omega)$  for the problem with  $y_0 \equiv 0$  and  $h \equiv 0$ . Now, by using the subdifferentiability of  $J(., a, y_d)$  at  $\hat{\varphi}^0$  ( $\neq 0$  by (17)), we know (see Remark 4) that

$$0 \in \partial J(\hat{\varphi}^0),$$

which is equivalent, from Lemma 5, to the existence of  $v \in \text{sgn}(\hat{\varphi})\chi_{\mathcal{O}}$ , such that

$$(21) \quad -|\hat{\varphi}|_{L^1(\mathcal{O})} \left( \int_{\mathcal{O}} v(x, t)\theta(x, t) dx dt \right) = \frac{\varepsilon}{|\hat{\varphi}^0|_2} \int_{\Omega} \hat{\varphi}^0(x)\theta^0(x) dx \\ - \int_{\Omega} y_d(x)\theta^0(x) dx.$$

On the other hand, as  $y \in W$ , if we “multiply” by  $(-\Delta)^k \theta$  in (20) we obtain by (8) and (15) that

$$(22) \quad (y(T), \theta^0)_{L^2(\Omega) \times L^2(\Omega)} = |\hat{\varphi}|_{L^1(\mathcal{O})} \left( \int_{\mathcal{O}} v(x, t)\theta(x, t) dx dt \right)$$

(Here we point out that, in order to be able to integrate by parts, we are taking into account that  $0 \leq 2k < m$ ). Then, from (21) and (22), we obtain

$$(y(T), \theta^0)_{L^2(\Omega) \times L^2(\Omega)} = (y_d - \varepsilon \frac{\hat{\varphi}^0}{|\hat{\varphi}^0|_2}, \theta^0)_{L^2(\Omega) \times L^2(\Omega)} \quad \forall \theta^0 \in L^2(\Omega)$$

and we conclude that  $y(T) = y_d - \varepsilon \frac{\hat{\varphi}^0}{|\hat{\varphi}^0|_2}$ .

## 5 Controllability for the nonlinear problem.

For the nonlinear case we shall need to use a fixed point Theorem for multivalued operators:

**Definition 4** Let  $X, Y$  two Banach spaces and,  $\Lambda : X \rightarrow \mathcal{P}(Y)$  a multivalued function. We say that  $\Lambda$  is upper hemicontinuous at  $x_0 \in X$ , if for every  $p \in Y'$ , the function

$$x \rightarrow \sigma(\Lambda(x), p) = \sup_{y \in \Lambda(x)} \langle p, y \rangle_{Y' \times Y}$$

is upper semicontinuous at  $x_0$ . We say that the multivalued function is upper hemicontinuous on a subset  $K$  of  $X$ , if it satisfies this properties for every point of  $K$ .

**Theorem 3 (Kakutani's fixed point Theorem).** Let  $K \subset X$  be a convex and compact subset and  $\Lambda : K \rightarrow K$  an upper hemicontinuous application with convex, closed and nonempty values. Then, there exists a fixed point  $x_0$ , of  $\Lambda$ .

For a proof see, for instance, Aubin [2] page 126.

**Proof of Theorem 1.** We fix  $y_d \in L^2(\Omega)$ ,  $\varepsilon > 0$  and we define

$$g(s) = \frac{f(s) - f(s_0)}{s - s_0}.$$

Then, from the assumptions, we have that  $g \in L^\infty(\mathbb{R}) \cap \mathcal{C}(\mathbb{R})$ .

Now, by using Theorem 2, for each  $z \in L^2(0, T; H_0^{2k}(\Omega))$  and  $\varepsilon > 0$  it is possible to find two functions  $\varphi(z) \in L^1(Q)$  and  $v(z) \in \text{sgn}(\varphi(z))\chi_{\mathcal{O}}$  such that the solution  $y = y^z$  of

$$(23) \quad \begin{cases} y_t + (-\Delta)^m y + g(\Delta^k z) \Delta^k y = h - f(s_0) + g(\Delta^k z) s_0 + u \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j y}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y(0) = y_0 & \text{on } \Omega, \end{cases}$$

(where  $u = u_{g(\Delta^k z)}$ ) satisfies

$$(24) \quad |y(T) - y_d|_{L^2(\Omega)} \leq \varepsilon.$$

Besides

$$(25) \quad \{ \|\varphi(z)\|_{L^1(\mathcal{O})} v(z), z \in L^2(0, T; H_0^{2k}(\Omega)) \} \text{ is bounded in } L^\infty(Q)$$

since, following the proof of Theorem 2,  $\varphi(z)$  is the solution of (15) with initial value  $M(g(\Delta^k z), y_d^z)$  (see Proposition 3) and potential  $g(\Delta^k z)$ , where  $y_d^z = y_d - y^z(T : 0)$ , with  $y^z(T : 0)$  the solution of (23) at time  $T$  for the control  $u = 0$ . Therefore, by applying Lemma 6, we obtain that  $y_d^z$  belongs to a compact set for all  $z \in L^2(0, T; H_0^{2k}(\Omega))$  and so, by using Proposition 3 and Proposition 1, we obtain (25).

**Lemma 6** The set

$$\{y_d^z, z \in L^2(0, T; H_0^{2k}(\Omega))\},$$

with  $y_d^z$  defined above is relatively compact in  $L^2(\Omega)$ .

**Proof of Lemma 6.** We can split the set of solutions  $y^z(\cdot : 0)$  of

$$\begin{cases} y_t + (-\Delta)^m y + g(\Delta^k z) \Delta^k y = h - f(s_0) + g(\Delta^k z) s_0 & \text{in } Q \\ \frac{\partial^j y}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y(0) = y_0 & \text{on } \Omega, \end{cases}$$

by  $y^z(\cdot : 0) = u + v$ , where  $u$  is the solution of

$$\begin{cases} u_t + (-\Delta)^m u = h - f(s_0) & \text{in } Q \\ \frac{\partial^j u}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ u(0) = y_0 & \text{on } \Omega \end{cases}$$

and  $v$  is the solution of

$$\begin{cases} v_t + (-\Delta)^m v + g(\Delta^k z)(\Delta^k u + \Delta^k v) = g(\Delta^k z) s_0 & \text{in } Q \\ \frac{\partial^j v}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ v(0) = 0 & \text{on } \Omega. \end{cases}$$

Then, by applying Proposition 1 and the results of Lions-Magenes [13] (see page 78), we obtain that there exists  $K > 0$  independent of  $z$  such that

$$\|v\|_{H^{1,2m}(Q)} \leq K(1 + \|y_0\|_{L^2(\Omega)} + \|h\|_{L^2(Q)}).$$

Finally, we take into account that  $H^{1,2m}(Q)$  is compactly imbedded in  $\mathcal{C}([0, T]; L^2(\Omega))$  and we conclude the result.

**End of the proof of Theorem 1.** Thus

$$(26) \quad K_1 = \sup_{z \in L^2(0, T; H_0^{2k}(\Omega))} \|\varphi(z)\|_{L^1(\mathcal{O})} < \infty.$$

Obviously, as we had seen in (18) and (19)  $u = u_{g(\Delta^k z)}$  satisfies

$$(27) \quad \|u\|_{L^2(Q)} \leq K_2.$$

Therefore, if we define the operator

$$\Lambda : L^2(0, T; H_0^{2k}(\Omega)) \rightarrow \mathcal{P}(L^2(0, T; H_0^{2k}(\Omega)))$$

by

$$\Lambda(z) = \{y \text{ satisfies (23), (24) for some } u \text{ satisfying (27)}\},$$

we have seen that for each  $z \in L^2(0, T; H_0^{2k}(\Omega))$ ,  $\Lambda(z) \neq \emptyset$ . In order to apply Kakutani's fixed point theorem, we have to check that the next properties hold:

- (i) There exists a compact subset  $U$  of  $L^2(0, T; H_0^{2k}(\Omega))$ , such that for every  $z \in L^2(0, T; H_0^{2k}(\Omega))$ ,  $\Lambda(z) \subset U$ .

(ii) For every  $z \in L^2(0, T; H_0^{2k}(\Omega))$ ,  $\Lambda(z)$  is a convex, compact and nonempty subset of  $L^2(0, T; H_0^{2k}(\Omega))$ .

(iii)  $\Lambda$  is upper hemicontinuous.

The proof of these properties is as follows:

(i) From Proposition 1 we know that, there exists a bounded subset  $U$  of  $\{y \in V : y_y \in V'\}$  such that for every  $z \in L^2(0, T; H_0^{2k}(\Omega))$ ,  $\Lambda(z) \subset U$ . Now, to see that we can choose  $U$  compact we shall prove that the set

$$\mathcal{Y} = \{y \text{ satisfying (23) for some } z \in L^2(0, T; H_0^{2k}(\Omega)) \text{ and } u \text{ verifying (27)}\}$$

is a relatively compact subset of  $L^2(0, T; H_0^{2k}(\Omega))$ . But this is easy to prove by using that

$$(28) \quad \{y \in V : y_t \in V'\} \subset L^2(0, T; H_0^{2k}(\Omega)) \text{ with compact imbedding}$$

(see Aubin [1]).

(ii) We have already seen that for every  $z \in L^2(0, T; H_0^{2k}(\Omega))$ ,  $\Lambda(z)$  is a nonempty subset of  $L^2(0, T; H_0^{2k}(\Omega))$ . Besides  $\Lambda(z)$  is obviously convex, because  $B(y_d, \varepsilon)$  and  $\{u \in L^2(Q) : \text{satisfying (27)}\}$  are convex sets. Then, we have to see that  $\Lambda(z)$  is a compact subset of  $L^2(0, T; H_0^{2k}(\Omega))$ . In (i) we have proved that  $\Lambda(z) \subset U$  with  $U$  compact. Let  $(y^n)_n$  be a sequence of elements of  $\Lambda(z)$  which converges on  $L^2(0, T; H_0^{2k}(\Omega))$  to  $y \in U$ . We have to prove that  $y \in \Lambda(z)$ . We know that there exist  $u^n \in L^2(Q)$  satisfying (27) such that

$$(29) \quad \begin{cases} y_t^n + (-\Delta)^m y^n + g(\Delta^k z) \Delta^k y^n = h - f(s_0) + g(\Delta^k z) s_0 + u^n \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j y^n}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y^n(0) = y_0 & \text{on } \Omega \\ |y^n(T) - y_d|_2 \leq \varepsilon. \end{cases}$$

Now, by using that the controls  $u^n$  are uniformly bounded, we deduce that  $u^n \rightarrow u$  in the weak topology of  $L^2(Q)$  and  $u$  satisfies (27). Therefore, if we pass to the limit in (29) we obtain

$$\begin{cases} y_t + (-\Delta)^m y + g(\Delta^k z) \Delta^k y = h - f(s_0) + g(\Delta^k z) s_0 + u \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j y}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y(0) = y_0 & \text{on } \Omega. \end{cases}$$

Besides,  $v^n = y - y^n$  is solution of

$$\begin{cases} v_t^n + (-\Delta)^m v^n + g(\Delta^k z) \Delta^k v^n = (u - u^n) \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j v^n}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ v^n(0) = 0 & \text{on } \Omega \end{cases}$$

and satisfies  $v^n \in H^{1,2m}(Q)$  (see [13]). Therefore,  $v^n$  is a strong solution and if we “multiply” by  $v^n$  and integrate, we obtain that

$$\|v^n(T)\|_{L^2(\Omega)}^2 \leq k \int_Q (u - u^n) \chi_{\mathcal{O}} v^n dx dt \rightarrow 0 \quad \text{as } n \rightarrow \infty.$$

Thus  $y^n(T)$  converges to  $y(T)$  in the topology of  $L^2(\Omega)$  and  $|y(T) - y_d|_2 \leq \varepsilon$ . This prove that  $y \in \Lambda(z)$  and concludes the proof of (ii).

(iii) We must prove that for every  $z_0 \in L^2(0, T; H_0^{2k}(\Omega))$

$$\limsup_{\substack{z_n \\ \xrightarrow{L^2(0, T; H_0^{2k}(\Omega))} z_0}} \sigma(\Lambda(z_n), k) \leq \sigma(\Lambda(z_0), k), \quad \forall k \in L^2(0, T; H^{-2k}(\Omega)).$$

We have seen in (ii) that  $\Lambda(z)$  is a compact set, which implies that for every  $n \in \mathbb{N}$  there exists  $y^n \in \Lambda(z_n)$  such that

$$\sigma(\Lambda(z_n), k) = \langle k(x, t), y^n(x, t) \rangle_{L^2(0, T; H^{-2k}(\Omega)) \times L^2(0, T; H_0^{2k}(\Omega))}.$$

Now, by (i),  $(y^n)_n \subset U$  (compact set). Then, there exists  $y \in L^2(0, T; H_0^{2k}(\Omega))$  such that (after extracting a subsequence)  $y^n \rightarrow y$  on  $L^2(0, T; H_0^{2k}(\Omega))$ . We shall prove that  $y \in \Lambda(z_0)$ . We know that there exist  $u^n \in L^2(Q)$  satisfying (27) such that

$$(30) \quad \begin{cases} y_t^n + (-\Delta)^m y^n + g(\Delta^k z_n) \Delta^k y^n = h - f(s_0) + g(\Delta^k z_n) s_0 + u^n \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j y^n}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y^n(0) = y_0 & \text{on } \Omega \\ |y^n(T) - y_d|_2 \leq \varepsilon. \end{cases}$$

Then there exists  $u \in L^2(Q)$  satisfying (27) such that  $u^n \rightarrow u$  in the weak topology of  $L^2(\mathcal{O})$ . On the other hand, by using the smoothing effect of the parabolic linear equation (in a similar way to the proof of (ii)) and that  $g \in L^\infty(\mathbb{R}) \cap \mathcal{C}(\mathbb{R})$ , we deduce that  $y$  satisfies (23) and (24) with  $z = z_0$  for some  $u \in L^2(Q)$  satisfying (27), which implies that  $y \in \Lambda(z_0)$ . Then, for every  $k \in L^2(0, T; H^{-2k}(\Omega))$ ,

$$\begin{aligned} \sigma(\Lambda(z_n), k) &= \langle k(x, t), y^n(x, t) \rangle_{L^2(0, T; H^{-2k}(\Omega)) \times L^2(0, T; H_0^{2k}(\Omega))} \\ &\rightarrow \langle k(x, t), y(x, t) \rangle_{L^2(0, T; H^{-2k}(\Omega)) \times L^2(0, T; H_0^{2k}(\Omega))} \\ &\leq \sup_{\bar{y} \in \Lambda(z_0)} \langle k(x, t), \bar{y}(x, t) \rangle_{L^2(0, T; H^{-2k}(\Omega)) \times L^2(0, T; H_0^{2k}(\Omega))} = \sigma(\Lambda(z_0), k), \end{aligned}$$

which proves that  $\Lambda$  is upper hemicontinuous and conclude the proof of (iii).

Finally, if we restrict  $\Lambda$  to  $K = \text{conv}(U)$  (the convex envelope of  $U$ ), which is a compact set in  $L^2(0, T; H_0^{2k}(\Omega))$ , it satisfies the assumptions of Kakutani's fixed point theorem. Then,  $\Lambda$  has a fixed point  $y \in K$ . Besides, by construction, there exists a control  $u \in L^2(Q)$  satisfying (27) such that

$$(31) \quad \begin{cases} y_t + (-\Delta)^m y + f(\Delta^k y) = h + u \chi_{\mathcal{O}} & \text{in } Q \\ \frac{\partial^j y}{\partial \nu^j} = 0, \quad j = 0, 1, \dots, m-1 & \text{on } \Sigma \\ y(0) = y_0 & \text{on } \Omega \\ |y(T) - y_d|_2 \leq \varepsilon. \end{cases}$$

Therefore,  $y$  is the solution that we were looking for.

## 6 Non-controllability for superlinear problems.

In this section we assume  $k = 0$ . We shall prove a result of non-controllability for a superlinear case with  $\bar{\omega} \subset \Omega$ .

**Theorem 4** *If  $p > 1$  and  $y_0 \in L^2(\Omega)$  the problem*

$$\begin{cases} y_t + (-\Delta)^m y + |y|^{p-1}y = u\chi_\omega & \text{in } Q \\ y(0) = y_0 & \text{on } \Omega \end{cases}$$

*with controls  $u \in L^2(Q)$  (or more general with  $u \in L^{r'}(Q)$  where  $r = p + 1 > 2$  and so  $r' \in (1, 2)$ ) and any boundary condition does not satisfy, in general, the approximate controllability property at time  $T$ .*

In order to prove this theorem we need some previous results.

**Young's inequality.** If  $a, B \geq 0$ ,  $\varepsilon > 0$  and  $q > 1$  then

$$(32) \quad AB \leq \varepsilon A^q + K(\varepsilon, q)B^{q'} \quad \text{with} \quad \frac{1}{K(\varepsilon, q)} = q'(q\varepsilon)^{q'/q}.$$

**Notation.** If we take  $R > 0$  we can define in  $\mathbb{R}^N$  the functions

$$\xi_R(x) = (R^2 - |x|^2)/R \quad \text{if } |x| < R, \quad \xi_R(x) = 0 \quad \text{if } |x| \geq R$$

and the powers  $\xi_R^s$  of the function  $\xi_R$ , where  $s > 1$  is a real number. We can also define

$$(33) \quad d_R(x) = R - |x| \quad \text{if } |x| < R, \quad d_R(x) = 0 \quad \text{if } |x| \geq R$$

and then, the following relation holds for all  $x \in \mathbb{R}^N$ .

$$(34) \quad d_R(x) \leq \xi_R(x) \leq 2d_R(x).$$

The following result was proved in Bernis [4].

**Proposition 5** *Let  $s \geq 2m$  and  $R > 0$ . Then, for each  $\varepsilon > 0$  there exist a constant  $C$  depending only on  $N, m, s$  and  $\varepsilon$  (thus independent of  $R$ ) such that the following inequality holds for all  $y \in H_{loc}^m(\mathbb{R}^n)$ :*

$$((-\Delta)^m y, \xi_R^s y)_{H_{loc}^{-m}(\mathbb{R}^N) \times H_c^m(\mathbb{R}^N)} \geq (1 - \varepsilon) \int_{\mathbb{R}^N} \xi_R^s |D^m y|^2 dx - C \int_{\mathbb{R}^N} \xi_R^{s-2m} y^2 dx.$$

**Remark 7** *Since  $s \geq 2m$ ,  $\xi_R^s \in W_c^{2m, \infty}(\mathbb{R}^N)$ . Hence  $\xi_R^s \in C_c^m(\mathbb{R}^N)$  (see e.g. Corollary IX.13 of [5]) and  $\xi_R^s u \in H_c^m(\mathbb{R}^N)$  (see e.g. Note 4 of Chapter IX of [5]).*

**Corollary 1** *Let  $s \geq 2m$  and  $R > 0$  such that  $\overline{B_R} \subset \Omega$ . Then, for each  $\varepsilon > 0$  there exist a constant  $C$  depending only on  $N, m, s$  and  $\varepsilon$  (thus independent of  $R$ ) such that the following inequality holds for all  $y \in H^m(\Omega)$ :*

$$((-\Delta)^m y, \xi_R^s y)_{H^{-m}(\Omega) \times H_0^m(\Omega)} \geq (1 - \varepsilon) \int_{\Omega} \xi_R^s |D^m y|^2 dx - C \int_{\Omega} \xi_R^{s-2m} y^2 dx.$$

**Proof.** We take  $\bar{y} \in H^m(\Omega)$  such that  $\bar{y} = y$  in  $\Omega$  (we can see that this  $\bar{y}$  exists in Theorem IX of Brezis [5]). Then we have the inequality for  $\bar{y}$ , but as  $\overline{B_R} \subset \Omega$  we obtain the result.

**Theorem 5** *Let  $p > 1$ ,  $r = p + 1$ ,  $y_0 \in L^2(\Omega)$  and  $u \in L^{r'}(Q)$ . Then any solution  $y \in L^r(Q) \cap L^2(0, T; H^m(\Omega))$  of*

$$(35) \quad \begin{cases} y_t + (-\Delta)^m y + |y|^{p-1} y = u & \text{in } \mathcal{D}'(Q) \\ y(0) = y_0 & \text{on } \Omega, \end{cases}$$

with any boundary conditions, satisfies the local estimate

$$\begin{aligned} & \sup_{0 < t < T} \int_{B_R} y(x, t)^2 dx + \int_{B_R \times (0, T)} (|D^m y|^2 + |y|^r) dx dt \\ & \leq K \left( 1 + \int_{B_{R_1} \times (0, T)} |u|^{r'} dx dt + \int_{B_{R_1}} y_0^2 dx \right) \end{aligned}$$

if  $\overline{B_{R_1}} \subset \Omega$  and  $0 < R \leq R_1$ . Besides, the constant  $K$  depends only on  $N$ ,  $m$ ,  $p$ ,  $R$ ,  $R_1$  and  $T$ .

**Remark 8** *The set of solutions of the problem in Theorem 5 is not the empty set since, for instance with Dirichlet conditions on the boundary, we know that there exists a unique solution (see e.g. Lions [10]).*

**Proof of Theorem 5.** We take  $X_r = L^r(Q) \cap L^2(0, T; H_0^m(\Omega))$ . Then the equality of the equation of (35) is in  $X_r' = L^{r'}(Q) + L^2(0, T; H^{-m}(\Omega))$ . Then, if  $s \geq 2m$ , we can multiply in (35) by  $\xi_R^s y$  with the duality product  $(\cdot, \cdot)_{X_r' \times X_r}$  and we obtain

$$\begin{aligned} & \frac{1}{2} \int_{B_R} \xi_R^s y(x, T)^2 dx + ((-\Delta)^m y, \xi_R^s y)_{L^2(0, T; H^{-m}(\Omega)) \times L^2(0, T; H_0^m(\Omega))} + (|y|^{p-1} y, \xi_R^s y)_{L^{r'}(Q) \times L^r(Q)} \\ & = \frac{1}{2} \int_{B_R} \xi_R^s y_0(x)^2 dx + (u, \xi_R^s y)_{L^{r'}(Q) \times L^r(Q)}. \end{aligned}$$

Now, from Corollary 1 it follows that

$$(36) \quad \begin{aligned} & \frac{1}{2} \int_{B_R} \xi_R^s y(x, T)^2 dx + \int_{B_R \times (0, T)} \xi_R^s (|D^m y|^2 + |y|^r) dx dt \\ & \leq C \int_{B_R} \xi_R^s y_0(x)^2 dx + C \int_{B_R \times (0, T)} \xi_R^{s-2m} y^2 dx dt + C \int_{B_R \times (0, T)} \xi_R^s u y dx dt. \end{aligned}$$

By (33) and (34) we can replace in (36)  $\xi_R(x)$  by  $R - |x|$  (modifying the constants). Besides, writing  $s - 2m = 2s/r + (s(r - 2)/r) - 2m$ , we can apply Hölder's or Young's inequality (32) with exponents  $q = r/2$  and  $q' = r/r - 2$  and we obtain

$$\begin{aligned} & \int_{B_R \times (0, T)} (R - |x|)^{s-2m} y^2 dx dt \\ & \leq \varepsilon \int_{B_R \times (0, T)} (R - |x|)^s |y|^r dx dt + K(\varepsilon, r/2) \int_{B_R \times (0, T)} (R - |x|)^{s-\gamma} dx dt \end{aligned}$$

with

$$\gamma = \frac{2mr}{r-2} \quad .$$

Hence, if we choose  $s > \gamma - 1$ , the last integral is finite and equal to  $\tilde{C}R^{s+N-\gamma}$ . On the other hand, we can apply again (32) and we have

$$\int_{B_R \times (0, T)} (R - |x|)^s u y dx dt \leq \varepsilon \int_{B_R \times (0, T)} (R - |x|)^s |y|^r dx dt + k(\varepsilon, r) \int_{B_R \times (0, T)} (R - |x|)^s |u|^{r'} dx dt.$$

Thus, by changing the constants, we deduce that

$$\begin{aligned} & \frac{1}{2} \int_{B_R} (R - |x|)^s y(x, T)^2 dx + \int_{B_R \times (0, T)} (R - |x|)^s (|D^m y|^2 + |y|^r) dx dt \\ & \leq C \left( \int_{B_R} (R - |x|)^s y_0(x)^2 dx + R^{s+N-\gamma} + \int_{B_R \times (0, T)} (R - |x|)^s |u|^{r'} dx dt \right). \end{aligned}$$

Finally, by replacing  $R$  by  $R_1$  and by taking into account that  $R_1 - |x| \geq R_1 - R$  and  $R_1 - |x| \leq R_1$  if  $|x| \leq R$  we deduce the result with

$$K = \max \left\{ C \left( \frac{R_1}{R_1 - R} \right)^s, \frac{C R_1^{s+N-\gamma}}{(R_1 - R)^s} \right\}.$$

**Proof of Theorem 4.** The proof of Theorem 4 is a consequence of Theorem 5 since, if  $R_1$  satisfies  $\overline{B_{R_1}} \subset \Omega \setminus \omega$ , then

$$\|y(u; T)\|_{L^2(\Omega)}^2 \leq K(1 + \|y_0\|_{L^2(\Omega)}^2) \quad \forall u \in L^{r'}(Q)$$

and if we take  $y_d$  such that  $\|y_d\|_{L^2(\Omega)}$  is large enough we cannot find a satisfactory control.

**Acknowledgements.** The authors thank to F. Bernis by the conversations held on this subject.
